# The EHEC-outbreak 2011

Since the second week in May several cases of infections with Enterohemorrhagic Escherichia coli (EHEC) have been reported in Europe.

- Complications resulting from the infection could lead to severe or deadly diseases.
- It is assumed that the sources of the outbreak are contaminated salads, raw vegetables or fruits.

- The EHEC-germs could be spread from human to human by smear infection – for example shaking hands!
- Regular and efficient hand hygiene as well as food hygiene is crucial to prevent infections

## Compliance with basic hygiene measures will offer protection.
